Continuation of 11. does NOT place the application in condition for allowance because:

the limitation in claim 1 reciting that the tool can be pressed against the workpiece at a minimum of three bearing points is entirely dependent upon the shape of the workpiece being ground, and the device of Yee is deemed to be capable of such contact, at least for some workpiece shapes. Applicant had further amended claim 1 to recite that the tool can be placed against a workpiece (19) and moved in a sliding or rolling manner and by means of which, while grinding the workpiece edge the tool can be pressed at at least three bearing points against the workpiece (19) so that the tool is stable in two directions without tilting, and thereby be slid or rolled along the workpiece edge. This limitation is also deemed to be anticipated by Yee. In Yee, a conventional angle grinder is shown, having an elongate housing and a right angle extension, with a shaft at right angle to the housing. The guard member (40) is deemed to constitute a guide, since it is fully capable of being applied against the work to steady the tool during use. Edges of the guide are read as stop elements, as broadly recited, since they can be used to prevent movement of the tool when applied against the work. The edges of the guide constitute contact surfaces, each of which would inherently contain a multiple of bearing points, which allow the tool to be slid along a workpiece edge.
